

Hot foil stamping machine Hydraulic

This machine is hydraulically operated and works on the UP/DOWN principle of stamping. The operator has to place the object in position and start the cycle. The cycle consists of stamping plate moving down and stays on the plate for the set stamping time. The stamping time can be preset in steps of 100 milli seconds. After this time the stamping plate moves up and the foil advances forward.

The Up/Down movement of the stamping plate is guided by two precision ground dove tail guides. The feeding and removal of the object is done manually. The machine has a built-in counter to count number of strokes and the count can be seen on the display panel.

All major items are either powder coated in Siemens Grey / Red Colour, hard chrome plated or electroless nickel-plated. The fasteners are also electroless nickel plated.

Major hydraulic components are from Yuken or equivalent make.

Plate heaters are used as heating elements and the temperature is controlled by "ON-

OFF" temperature controller.

Technical Specifications

- Stamping Force : 5000 kgf
- Stamping Plate size : 300 x 350 mm
- Table Size : 400 x 450 mm
- Job Height : 125 mm
- Heaters : 1000 W x 2 Nos.
- Power Consumption : 3.2 KW, 3 Phase, 415 Volts, 50Hz
- Dimensions : 1000mm x 1000mm x 1800mm ht.
